Report Overview

The Hall effect open-loop current sensor is a current sensor designed based on the Hall effect principle, which usually consists of a Hall element, a magnetic core and a signal processing circuit. The working principle of this sensor is to generate a magnetic field in the magnetic core through a current, and then activate the Hall element, and the Hall element will generate a voltage signal, which is proportional to the magnitude of the passing current. The signal processing circuit will amplify, linearize and filter the voltage signal, and output a voltage or current signal proportional to the magnitude of the current. The Hall effect open-loop current sensor has the advantages of high precision, high stability, low drift and fast response. At the same time, due to its open-loop design, it will not be affected by external magnetic fields and can adapt to harsh environments such as high temperature and high pressure. This kind of sensor is usually used in industrial automation, power monitoring, electric vehicles and other fields, and can realize high-precision measurement and control of current.

The global Hall Effect Open Loop Current Sensor market size was estimated at USD 350.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
