Abstracts

Halobutyl rubber is obtained through the halogenation of the isoprene groups of the butyl rubber, producing a rubber with improved properties and characteristics. HIR presents higher curing rates and can easily co-vulcanize in elastomer blends with other rubbers. Halobutyl rubber primary application in tire inner liners and tubes for automobiles provides a strong growth opportunity. With the rising demand for vehicles, especially electric vehicles (EVs), the need for more efficient and durable tires is growing. Halobutyl rubber's excellent air retention, heat resistance, and impermeability make it ideal for this use. Moreover, halobutyl rubber is widely used in pharmaceutical closures (e.g., vial stoppers, seals) and medical products. The global expansion of healthcare infrastructure and growing demand for pharmaceutical products, especially in developing markets, offer significant growth potential. There are mainly three producers of halobutyl rubber in China. In August 2018, five-year anti-dumping duties on halobutyl rubber from the United States, the EU and Singapore were imposed by China. In Sep, 2024, China will continue to impose anti-dumping duties on halobutyl rubber originating from the United States, the European Union (EU), the United Kingdom (UK) and Singapore. Duties ranging from 23.1 to 75.5 percent will be levied toward the related companies for a five-year period, according to the ministry.

The global Halobutyl Rubber market size was estimated at USD 5346.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
