Abstracts

Halogenated flame retardants are a class of chemical compounds containing bromine or chlorine that are incorporated into materials such as plastics, textiles, and electronics to inhibit or suppress the combustion process by interfering with the chemical reactions that sustain fire. These additives function primarily through a gas-phase mechanism, releasing halogen radicals that scavenge high-energy free radicals responsible for flame propagation. While highly effective in reducing flammability and delaying ignition, their widespread use has raised significant environmental and health concerns due to their persistence, bioaccumulation potential, and toxicity, prompting regulatory scrutiny and a gradual shift toward alternative non-halogenated solutions in many applications.

The global Halogenated Flame Retardants market size was estimated at USD 3500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
