Abstracts

Hand held plasma cutters are portable thermal cutting devices that utilize an accelerated jet of hot plasma to slice through electrically conductive materials, primarily metals such as steel, stainless steel, aluminum, brass, and copper. These tools operate by generating an electric arc through a gas—often compressed air or other gases like nitrogen or oxygen—that is forced through a constricted nozzle, ionizing the gas into plasma and reaching temperatures high enough to melt the material while a high-velocity stream blows the molten metal away, resulting in a clean, precise cut. They are distinguished from other cutting methods by their portability, speed, and ability to make intricate cuts without physical contact, making them indispensable in industries requiring on-site or flexible metal fabrication, repair, and demolition work.

The global Hand Held Plasma Cutter market size was estimated at USD 382.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
