### Report Overview

The handheld nuclide recognition instrument is a portable device used for detecting and identifying radioactive substances. It is usually used in areas where there may be a risk of exposure to ionizing radiation, such as nuclear power plants, hospitals, and laboratories. The working principle of this device is to measure the energy and radiation type emitted by the radiation source, and compare it with a known radioactive isotope database. This enables the device to identify specific isotopes present in the sample. Emergency personnel, first responders, and hazardous materials teams often use handheld nuclide recognition instruments to quickly assess the potential hazards caused by radioactive sources. They can also be used for environmental monitoring, nuclear waste management, and nuclear safety applications.
