## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hands Off Detection (HOD) System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Hands-Off Detection (HOD) system is a safety monitoring device used in vehicle automated driving assistance (Level 2+ ADAS) or semi-autonomous driving systems. It detects in real time whether the driver is holding the steering wheel. If the system detects the driver's hands off the steering wheel for an extended period, it issues a warning or triggers automatic control logic to ensure driving safety. HOD systems are typically integrated into the steering wheel using capacitive sensors, pressure sensors, or other contact/non-contact technologies. Some high-end models also incorporate steering wheel heating or multi-function electronic modules. In the HOD system supply chain, the upstream suppliers primarily include sensor chip manufacturers, control module suppliers, and steering wheel structure and material providers. The downstream suppliers primarily include original equipment manufacturers (OEMs), including Mercedes-Benz, BMW, Tesla, and Volvo. The systems become part of automated driving or driver assistance features through integration into steering wheel assemblies or ADAS electronic modules. They may also be packaged and delivered to OEMs through Tier 1 suppliers. In 2024, global Hands Off Detection (HOD) System production reached 20.26 million units, with an average global market price of around US\$ 114 per unit.

The global Hands Off Detection (HOD) System market size was estimated at USD 2309.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.90% during the forecast period.
