Report Overview:

Handsets consist of two types of photo flash LEDs, namely xenon flash and white LEDs. Xenon flash is used in both film and standalone digital cameras. White LED illumination is mostly used in camera phones. LEDs are faster than xenon flash and also enable flash lighting in the video mode, which is not possible with xenon flash. Flash LEDs are brighter and provide two types of lighting: blue LED and white LED. Both these lightings use Indium Gallium Nitride (InGaN). In flash applications, LEDs operate on a pulse current, which is a brief burst of direct current (DC).

The Global Handset Flash LED Modules Market Size was estimated at USD 1624.53 million in 2023 and is projected to reach USD 3509.86 million by 2029, exhibiting a CAGR of 13.70% during the forecast period.
