Abstracts

A Hard-Bearing Balancing Machine is a device used to measure and correct imbalance problems in rotating machinery such as engines, motors, fans, etc. It is widely used in manufacturing and maintenance industries to ensure the balance of rotating machinery at high speeds. The working principle of the hard bearing dynamic balancing machine is based on the concept of dynamic balance. When there is an imbalance in a rotating machine, centrifugal forces are created on the shaft, causing vibration and noise, and possible damage to machine components and bearings. The hard bearing dynamic balancing machine rotates the machine and measures the vibration signal to determine the location and size of the imbalance, and then take corresponding corrective measures.

The global Hard Bearing Dynamic Balancing Machine market size was estimated at USD 285.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
