Report Overview:

Brake wear, tire wear, and fossil fuel combustion are the causes of severe fine particle pollution in all vehicles equipped with internal combustion engines, electric or hybrid power drives. The automotive industry needs alternative methods and technological solutions to reduce brake wear. The new hard coating process provides high-quality anti-corrosion and wear-resistant hard material coatings for brake discs. When the coating configuration is optimized, it can be combined with the brake disc to achieve optimal friction matching in terms of braking performance and minimum fine particle emissions.

The braking system of passenger cars has gradually evolved from front and rear drum type to front and rear disc type, as well as better ventilation discs and even high-performance car brake discs with lines and holes. In order to improve braking force, the brake discs are made of hard alloy with a special coating, and the brake pads are compressed and bonded with various metal powders.

The Global Hard Coated Brake Discs Market Size was estimated at USD 342.43 million in 2023 and is projected to reach USD 558.67 million by 2029, exhibiting a CAGR of 8.50% during the forecast period.
