Abstracts

A hard disk destroyer, also known as a hard disk degaussing machine or a multifunctional magnetic storage medium information destruction machine, is a device that can quickly and thoroughly destroy all data information on storage media such as hard disks, USB flash drives, CF cards, and memory sticks. Hard disk destroyers mainly use physical or electromagnetic methods to destroy hard disk data. For traditional mechanical hard disks, degaussing can be used to destroy the magnetic storage information on the hard disk through a strong magnetic field, making the data unreadable. As for solid-state hard disks, since they use flash memory chips as storage media, the data storage method is different from that of mechanical hard disks. Therefore, solid-state hard disk destruction machines need to use more advanced technical means, such as high-frequency electromagnetic waves, to destroy the data storage structure in the flash memory chip to ensure that the data cannot be recovered.

The global Hard Disk Destroyer market size was estimated at USD 171.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
