Abstracts

Hard disk data recovery service refers to the process of extracting, repairing and restoring data from hard disk storage devices that have lost or become inaccessible due to physical damage, logical failure, misoperation or natural disasters through professional technical means. This service is based on the working principle of storage media (such as magnetic recording, solid-state flash memory, etc.) and data organization (such as file system, partition table, database structure), and comprehensively uses hardware repair, firmware analysis, underlying data reorganization and file system analysis to maximize the recovery of users' lost original data. The service scope covers scenarios such as head damage, disk scratches, and firmware failure of mechanical hard disks (HDDs), as well as failure of the main control chip of solid-state drives (SSDs), bad blocks of flash memory particles, and false triggering of TRIM instructions, as well as data loss caused by logical problems such as accidental deletion, formatting, partition table damage, and virus attacks. The market is primarily driven by the growing demand for data recovery services in various industries such as IT, healthcare, BFSI and others. Furthermore, the increasing adoption of cloud computing and the rise of big data analytics has led to the creation of huge amounts of data, thus driving the demand for hard drive data recovery services. Additionally, the growing number of incidences of data loss due to accidental deletion, system crashes, and hard drive failures are also anticipated to propel the growth of the market.

The global Hard Drive Data Recovery Service market size was estimated at USD 2778.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.40% during the forecast period.
