## Abstracts

Hepatocellular carcinoma (HCC) is the seventh most common cancer diagnosis worldwide with high associated mortality. HCC is a unique malignancy, as it typically arises in the setting of chronic liver disease in particular cirrhosis, with competing risks of liver failure, contributing to its low 5-year survival rates of 18%-20%. More than half of worldwide HCC-related deaths occur in Asia, due to endemic hepatitis B (HBV) infection. HCC incidence is rising in many Western countries due to the rising prevalence of nonalcoholic fatty liver disease, alcohol-related liver disease, and hepatitis C (HCV)-related complications despite the availability of direct acting antiviral therapies. The search for biomarkers in hepatocellular carcinoma continues despite recent approvals for immune checkpoint inhibitor combinations, tyrosine kinase inhibitors [TKIs], and antiangiogenic agents. Biomarkers can be either predictive or prognostic and the only biomarker that has been used clinically is the prognostic biomarker  $\alpha$ -fetoprotein (AFP).

The global Hcc Hepatocellular Carcinoma Biomarker market size was estimated at USD 890.04 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
