Abstracts

Headless arthrodesis screws are specialized orthopedic implants designed to facilitate joint fusion (arthrodesis) by providing rigid internal fixation without a prominent screw head, thereby minimizing soft tissue irritation and allowing for a lower profile construct. These screws are typically cannulated to enable precise placement over a guidewire and are threaded along their entire length or in specific zones to enhance compression and stability across the fusion site. Constructed from biocompatible materials such as titanium or stainless steel, they often feature self-tapping tips and advanced surface treatments (e.g., hydroxyapatite coating) to improve osseointegration and pullout strength. Their design is optimized for use in small joints?such as those in the hand, wrist, foot, and ankle?where space is limited and anatomical preservation is critical, making them distinct from traditional headed screws used in larger bone segments.

The global Headless Arthrodesis Screw market size was estimated at USD 152.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
