Abstracts

Headspace sampling systems are analytical instruments used for the extraction and analysis of volatile organic compounds (VOCs) from solid, liquid, or gas samples by heating the sample in a sealed vial to partition these compounds into the gas phase (headspace), which is then injected into a gas chromatograph or other detection system for separation, identification, and quantification, with applications spanning environmental monitoring, food and beverage quality control, pharmaceutical testing, forensic science, and clinical diagnostics due to their advantages in minimizing sample preparation, reducing matrix interference, and enhancing reproducibility in trace-level analysis.
