Report Overview

The heart tilting disc valve is a type of mechanical heart valve used in cardiac surgery to replace a diseased or malfunctioning heart valve. It is composed of a circular disc made of a biocompatible material, such as titanium or pyrolytic carbon, which is attached to a metal frame. The tilting disc valve operates through the movement of the disc, which opens and closes to regulate blood flow. When the heart contracts, the pressure forces the disc to open, allowing blood to flow through. Conversely, when the heart relaxes, the disc closes, preventing any backward flow of blood. Heart tilting disc valves are known for their durability and longevity, as well as for their excellent hemodynamic performance. However, they require lifelong anticoagulant medications to prevent blood clotting due to the mechanical nature of the valve. The market prospect for heart tilting disc valves is significant. With a growing aging population and increasing instances of heart valve diseases, there is a rising demand for reliable and effective cardiac replacement valves. The durability and excellent fluid dynamics of tilting disc valves make them an attractive choice for patients undergoing valve replacement surgery. Additionally, ongoing advancements in design and materials offer opportunities for further improvement in the performance and lifespan of these valves.
