## Abstracts

Heat conducting fillers are specialized materials, often in the form of powders, pastes, or pads, that are incorporated into thermal interface materials (TIMs) to enhance thermal conductivity between two surfaces, such as a microprocessor and a heat sink; these fillers work by displacing air—a poor conductor of heat—and creating a continuous, low-thermal-resistance pathway for efficient heat dissipation, and common materials used include ceramic particles (e.g., aluminum oxide, boron nitride), metals (e.g., silver, aluminum), carbon-based substances (e.g., graphene, carbon nanotubes), or hybrid compositions, with selection depending on factors like thermal performance requirements, electrical insulation needs, cost constraints, and ease of application in electronics, automotive systems, LED lighting, energy storage, and other high-heat applications.

The global Heat Conducting Filler market size was estimated at USD 720.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
