Report Overview:

Heat-curing adhesives use thermosetting resins containing reactive groups as adhesives. When the curing agent is added or heated, the molecules of the liquid adhesive can be further polymerized and cross-linked to form a network structure, forming an insoluble and infusible solid adhesive layer to achieve the purpose of bonding. The thermal curing adhesive has high bonding strength. At the same time, it has excellent heat resistance, aging resistance and chemical resistance. It can be cured at room temperature or cured by heating. The former is called room temperature curing adhesive, and the latter is called heating curing adhesive.

The Global Heat-Curing Adhesives Market Size was estimated at USD 1237.58 million in 2023 and is projected to reach USD 1816.01 million by 2029, exhibiting a CAGR of 6.60% during the forecast period.
