Abstracts

Heat Not Burn (HnB) devices, also referred to as tobacco heating systems, are electronic devices designed to heat specially designed tobacco sticks or capsules to a temperature that releases nicotine-containing aerosol without combustion, thereby producing significantly fewer harmful chemicals compared to conventional cigarettes while aiming to deliver a sensory experience closer to smoking than e-cigarettes. These systems operate within a controlled temperature range, typically between 250?350?C, avoiding the production of smoke and instead generating an inhalable aerosol by heating the tobacco material just enough to extract flavors and nicotine. The core components generally include a battery-powered heating element, a chamber for the tobacco unit, and often smart features like temperature control or usage tracking, positioning HnB as a hybrid product category bridging traditional tobacco and next-generation nicotine alternatives with an emphasis on harm reduction for adult smokers.

The global Heat Not Burn (Hnb) Devices market size was estimated at USD 17650.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.50% during the forecast period.
