Abstracts

A heat pipe loop system is a heat transfer system that usually consists of one or more heat pipes that form a closed loop or cycle. In a heat pipe loop system, one port of the heat pipe (usually the evaporator) receives heat, causing the working fluid in it to evaporate into a gas, which then flows through the pipe to another port (usually the condenser), where it releases the heat and condenses again. As liquid, it eventually returns to the evaporator port, forming a closed thermal cycle. Heat pipe loop systems are typically designed to transport and dissipate heat for thermal management and heat dissipation purposes. They are commonly used in areas that require efficient heat transfer and temperature control, such as electronic equipment, aerospace, automotive industry, etc. Heat pipe loop systems are simple, reliable and efficient and suitable for a variety of environments and working conditions. With the growth of global energy demand and the improvement of environmental awareness, the market size of heat pipe loop systems as efficient and energy-saving heat transfer devices is constantly expanding. This growth trend is particularly obvious in emerging industries such as new energy vehicles and 5G communications, where there is an increasingly strong demand for high-performance thermal management systems. In addition, the application of new materials, the introduction of advanced manufacturing technologies, and the design of new heat pipes (such as evaporator-enhanced heat pipes, micro-channel heat pipes, etc.) have further improved the performance of heat pipe loop systems and expanded their application scope. To sum up, the heat pipe loop system market is currently in a stage of rapid development.

The global Heat Pipe Loop System market size was estimated at USD 471.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
