Report Overview:

A heat pump dryer is an innovative type of clothes dryer that uses heat pump technology to efficiently dry laundry. Unlike traditional dryers that rely on electric or gas heating elements, heat pump dryers use a closed-loop system to recycle and reuse heat, resulting in significant energy savings. The working principle of a heat pump dryer involves three main stages: air circulation, heat extraction, and heat release. First, the dryer circulates ambient air through the drum, where the moist air absorbs moisture from the wet clothes. Then, the air passes through an evaporator, where heat is extracted from the air by evaporating a refrigerant. This process cools the air and condenses the moisture, which is collected and drained away. The cool, dry air then passes through a compressor, which raises its temperature, and it is reheated by passing over the condenser. Finally, the hot, dry air is circulated back into the drum to continue the drying process.

The Global Heat Pump Dryer Market Size was estimated at USD 1577.41 million in 2023 and is projected to reach USD 6905.07 million by 2029, exhibiting a CAGR of 27.90% during the forecast period.
