Report Overview

The Heat Recovery Steam Generator (HRSG) for Gas Turbines is a specialized device that recovers waste heat from the exhaust gases of a gas turbine and converts it into steam. This process allows for more efficient energy utilization in power generation plants. The HRSG consists of several heat exchanger sections that sequentially extract heat from the gases, using it to generate high-pressure and low-pressure steam. This steam can then be used for various purposes, including power generation, heating, or industrial processes. The HRSG optimizes energy production by utilizing the waste heat that would otherwise be lost, resulting in increased overall plant efficiency and reduced environmental impact.
