Abstracts

Heat-reducing carbon-based composite materials are a type of composite materials that use carbon-based materials as the main component and are designed to have excellent heat - dissipation or heat - insulation properties, aiming to effectively reduce the temperature of objects. The high thermal conductivity of the carbon-based materials themselves enables heat to be quickly conducted within the material, thereby rapidly transferring the heat generated inside the object to the surface and accelerating the heat - dissipation rate. By adjusting the surface properties of the material or adding specific radiation agents, the material can efficiently emit heat in the form of thermal radiation. After the surface of some carbon-based composite materials is specially treated, it has a high infrared emissivity and can radiate heat in the form of infrared rays into the surrounding space. The added low - thermal - conductivity substances or the formed porous structures can impede the transfer of heat, playing a role in heat insulation, reducing the heat loss to the surrounding environment, or preventing the external heat from entering the inside of the object.

The global Heat-reducing Carbon-based Composite Materials market size was estimated at USD 2370.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
