Report Overview:

A heat stabilizer, also known as a thermal stabilizer, is a chemical additive used to prevent or slow down the degradation or breakdown of materials when exposed to heat. Heat stabilizers are commonly utilized in the manufacturing and processing of various polymers and plastics. Heat Stabilisers are antioxidants that are used to protect biopolymers from the degrading effects of heat during processing or use. When certain materials, such as PVC (polyvinyl chloride), are subjected to high temperatures during processing or end-use applications, they can undergo thermal degradation. This degradation can cause discoloration, loss of physical properties, and reduced performance of the material. Heat stabilizers help to mitigate these effects by preventing or slowing down the degradation process.

The Global Heat Stabiliser Market Size was estimated at USD 2896.05 million in 2023 and is projected to reach USD 3728.31 million by 2029, exhibiting a CAGR of 4.30% during the forecast period.
