Abstracts

Aluminum heat transfer composite material is a new type of aluminum alloy material, with the aluminum-manganese 3-series alloy as the core material (also known as the core layer). Through the roll bonding process, the core material is metallurgically bonded with one or more aluminum alloys of different physical and chemical properties at the contact surfaces. Compared to single-metal materials, the combination of different metals enhances various properties, including thermal expansion, thermal conductivity, strength, corrosion resistance, and electrical conductivity, significantly improving overall performance.

The global Heat Transfer Aluminum Alloys market size was estimated at USD 1230.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.10% during the forecast period.
