Report Overview

Heat-treated and Thermal Modified Wood, also known as thermally modified wood, are terms used interchangeably to refer to wood that has undergone a specific heat treatment process to enhance its properties. This treatment involves subjecting the wood to high temperatures, usually between 160-240°C, in a controlled environment with limited oxygen. The heat modifies the chemical structure of the wood, resulting in improved dimensional stability, resistance to moisture, decay, and insect attacks. The process also alters the wood's color, giving it a darker hue. Heat-treated and Thermal Modified Wood find applications in outdoor decking, siding, cladding, and interior design, offering a durable, eco-friendly, and aesthetically pleasing alternative to traditional wood products.
