Report Overview

Heat Treated Timber, also known as thermally modified timber or heat-treated wood, refers to wood that has undergone a specific heat treatment process to improve its properties. The timber is subjected to high temperatures in a controlled environment, altering its chemical and physical characteristics without the need for chemical additives. The process enhances the wood's dimensional stability, making it more resistant to warping, shrinking, or swelling caused by moisture changes. Additionally, heat-treated timber exhibits improved resistance to decay, insects, and fungal attacks, reducing the need for chemical preservatives. This eco-friendly and sustainable wood product finds applications in various industries, including construction, decking, landscaping, and outdoor furniture.
