Abstracts

Heated breathing circuits are medical devices designed to deliver warm, humidified gases to patients during mechanical ventilation or respiratory therapy by incorporating heating elements along the tubing to prevent condensation, maintain airway humidity, and reduce the risk of hypothermia and mucosal damage. These circuits are essential in critical care, anesthesia, and neonatal settings, where precise control of inspired gas conditions is crucial for patient safety and comfort, and they typically consist of a heated wire system embedded within the circuit, often integrated with humidifiers and temperature sensors to ensure optimal performance and minimize complications associated with cold, dry air delivery.
