Abstracts

Heated circulating baths, also known as thermostatic baths or circulation baths, are laboratory instruments designed to provide precise and stable temperature control for samples immersed in a liquid bath, typically water, oil, or other heat transfer fluids, through the use of an integrated heating element and a circulation pump that ensures uniform temperature distribution by continuously moving the fluid throughout the chamber. These devices are essential in scientific, industrial, and medical settings for applications requiring consistent thermal conditions, such as chemical reactions, sample incubation, viscosity testing, calibration of temperature-sensitive equipment, and material testing, offering temperature ranges that can vary from just above ambient to several hundred degrees Celsius depending on the model and fluid used.
