Abstracts

The heated THC (total hydrocarbon) analyzer is an instrument specially designed to measure the concentration of total hydrocarbons (THC) in the sample gas. It heats the sample gas to prevent high molecular weight hydrocarbons from condensing in the sample inlet line, thereby ensuring the accuracy of the measurement. This type of analyzer usually uses a hydrogen flame ionization detector (FID) as the detection principle, and determines the concentration of THC by measuring the current generated by the sample gas after it is ionized in the flame. With the improvement of global environmental awareness and the continuous development of industrial technology, the demand for monitoring gas emissions is increasing, which has driven the growth of the THC analyzer market. As one of the important economies in the world, the Chinese market is also expanding. With the continuous advancement of heated THC analyzer technology and the continuous expansion of its application areas, its market demand is also increasing. For example, applications in environmental protection, industry, agriculture and other fields will further promote the expansion of the market size.

The global Heated THC Analyzer market size was estimated at USD 232.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.20% during the forecast period.
