Abstracts

A heater burnout detector is an electronic safety device designed to monitor the operation of electric heating elements, such as those found in industrial furnaces, ovens, water heaters, or HVAC systems, and to detect failures?such as open circuits, short circuits, or partial element degradation?that could indicate a burnout condition. By continuously measuring electrical parameters like current, voltage, or resistance, the device identifies deviations from normal operating ranges and triggers alarms, shutdowns, or notifications to prevent equipment damage, energy waste, production downtime, or safety hazards. These systems are critical in applications where undetected heater failure could lead to significant operational, financial, or safety consequences, and they often integrate with broader automation or building management systems for centralized monitoring and control.

The global Heater Burnout Detector market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
