Abstracts

Heating ultrasonic cleaners are specialized industrial or laboratory devices that utilize high-frequency sound waves (ultrasonic energy) combined with controlled heating elements to agitate and thermally enhance cleaning solutions, thereby removing contaminants such as grease, oils, particulates, and biological residues from a wide range of materials and components. These systems typically operate at frequencies between 20-80 kHz, with integrated heaters maintaining solution temperatures from ambient to around 80°C, optimizing cavitation effects and solvent activity for improved degreasing, sterilization, and precision cleaning in applications where residue-free outcomes are critical. They are commonly used for cleaning mechanical parts, surgical instruments, electronic components, jewelry, and optical lenses, offering advantages over traditional methods through reduced cleaning time, lower chemical usage, and the ability to clean complex geometries without manual scrubbing.

The global Heating Ultrasonic Cleaners market size was estimated at USD 183.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
