Abstracts

The heatless regenerative adsorption dryer is a highly efficient and energy-saving gas drying equipment, mainly used to remove moisture from compressed air or other industrial gases, and is suitable for industrial applications with high requirements for gas dew point. Its core principle is to use adsorbents (such as activated alumina or molecular sieves) to physically adsorb moisture in the gas, and to achieve the drying and regeneration process by alternating two sets of adsorption towers. While one tower adsorbs moisture, the other tower regenerates with a small amount of dried gas without the need for external heat source support. The equipment can usually reach a low dew point of -40°C to -70°C, providing a clean and dry gas environment for production. The design features of the heatless regenerative adsorption dryer include simple structure, easy installation, high degree of automation, low energy consumption, and low maintenance cost.

The global Heatless Regenerative Adsorption Dryer market size was estimated at USD 544.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
