Abstracts

Heavy duty gas turbines are large-scale, continuous-duty rotating machines designed for power generation and mechanical drive applications, primarily converting the chemical energy of natural gas or liquid fuels into mechanical energy through the Brayton cycle, featuring high power output (typically ranging from 40 MW to over 500 MW per unit), high efficiency (especially in combined cycle configurations), robust construction for long operational lifespans, and the ability to provide grid stability through fast start-up and load-following capabilities. These turbines are engineered for base-load or peak-shaving power plants, industrial complexes, and offshore platforms, often integrated with heat recovery systems to maximize energy utilization, and are characterized by their multi-stage compressors, combustion systems, and turbines that operate at extreme temperatures and pressures to achieve optimal performance and fuel flexibility.
