Report Overview

Heavy foils are made out of different materials, mainly high-polymeric materials that are viscoelastic (bitumen or plastic). They can also be delivered in a self-adhesive version and are further processed in combination with other soundproofing products to create composite products. These heavy foils work by adding mass and density to surfaces, limiting the transmission of sound waves through walls, floors, ceilings, or other structural elements. They can be applied as an additional layer to existing surfaces or incorporated during construction or renovation projects.

The global Heavy Foils For Noise Reduction market size was estimated at USD 385.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
