Report Overview:

A heavy oil burner refers to a type of combustion system designed specifically for burning heavier grades of fuels such as residual oils and distillates produced as petroleum derivatives during refining processes. These substances typically possess higher viscosity ranges compared to lighter crude oil fractions like naphtha or kerosene commonly used in regular burners intended for natural gas, liquefied petroleum gas (LPG), or diesel. Due to the complex chemical compositions and physical properties inherent in heavy fuels, dedicated equipment must handle them safely and efficiently while meeting emission limits set forth by environmental authorities worldwide.

The Global Heavy Oil Burner Market Size was estimated at USD 3722.77 million in 2023 and is projected to reach USD 4342.60 million by 2029, exhibiting a CAGR of 2.60% during the forecast period.
