## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on HEL Nanoimprinter competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. HEL Nanoimprinter is a micro-nanofabrication device based on the principle of physical imprinting. It achieves high-precision structure replication under heat and pressure by mechanically contacting a template bearing a nanoscale pattern with a substrate coated with a thermoplastic material. Its core advantage lies in surpassing the diffraction limit of traditional optical lithography, enabling pattern transfer with sub-10 nanometer resolution. Its equipment cost is 30%-50% lower than extreme ultraviolet lithography (EUV), making it suitable for batch processing of large substrates. This technology leverages the deformation properties of thermoplastic materials to achieve pattern transfer at temperatures below 230°C, with a temperature control accuracy of ±2°C. Operating in a vacuum environment ensures uniform imprinting. Global sales of hot imprint nanoimprinters are expected to reach 320 units in 2024, with an average selling price of US\$250,000 per unit. In terms of the industrial chain, upstream core materials include high-precision nickel-based alloy molds, low-shrinkage UV-curable resins, and nanoimprint adhesives, which are currently dominated by Japanese and German companies. However, China is accelerating domestic substitution in key materials such as photoresists. The molds developed by local companies have a hardness of 60HRC, a lifespan of over 10,000 times, and a resin line width control accuracy of ±5 nanometers. Midstream equipment manufacturing presents a vertical integration model of leading companies, covering the entire chain from mold design, equipment manufacturing to process optimization. Local companies have an overlay accuracy of 3 nanometers and a production capacity of over 200 wafers/hour, which is on par with international levels. Downstream applications cover semiconductor

memory chip graphics, AR/VR optical components, biomedical microfluidic chips and other fields. Among them, the surge in demand for AR/VR equipment has driven the growth of orders for UV imprint equipment. With policy support and industrial chain collaboration, China's hot embossing nanoimprint machine industry is shifting from technological catch-up to global competition.

The global HEL Nanoimprinter market size was estimated at USD 80.11 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.60% during the forecast period.
