## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Helical Baffle Heat Exchangers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Helical Baffle Heat Exchangers use continuous spiral baffles instead of traditional bowed baffles to achieve more efficient heat transfer. Compared to traditional heat exchangers, this design allows the shell-side fluid to flow in a spiral pattern, reducing dead zones and turbulence, thereby improving heat transfer efficiency. Global sales in 2024 are expected to be approximately 1,500 units, with an average market price of approximately US\$10 per unit. The industry's gross profit margin is expected to be between 15% and 35%. The Helical Baffle Heat Exchanger is mainly composed of tube sheets, spiral baffles, heat exchange tubes, shells, sealing rings, heads and other components. Among them, the spiral baffles are important components for improving the efficiency of the heat exchanger. They are installed in the shell side, not only providing support for the heat exchange tubes, but also allowing the shell side medium to flow along specific channels to improve heat transfer performance. In the downstream link, the equipment is mainly used in heat exchange and waste heat recovery systems in the petrochemical, coal chemical, power, energy and other industries.

The global Helical Baffle Heat Exchangers market size was estimated at USD 150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
