Abstracts

A helical wind turbine is a type of wind turbine characterized by its helical or spiral blade design, which allows it to capture wind energy efficiently from any direction. Unlike traditional horizontal-axis wind turbines, which typically have blades that rotate around a horizontal shaft, helical turbines have blades that are twisted in a spiral shape, enabling them to harness wind energy more effectively in turbulent or variable wind conditions. This design can reduce noise and vibration, and often requires less maintenance. Helical wind turbines are particularly suited for urban environments or areas with inconsistent wind patterns, making them an innovative option for renewable energy generation.

The global Helical Wind Turbine market size was estimated at USD 5849.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
