### Report Overview:

A flight simulator is a device that artificially re-creates aircraft flight and the environment in which it flies, for pilot training, design, or other purposes. It includes replicating the equations that govern how aircraft fly, how they react to applications of flight controls, the effects of other aircraft systems, and how the aircraft reacts to external factors such as air density, turbulence, wind shear, cloud, precipitation, etc. Flight simulators are widely used in pilot training, aircraft design, airborne equipment testing and other applications. The primary purpose of utilization of flight simulator is to train a pilot to achieve, test, and maintain proficiency in the operation of an airplane without risk to person or property and at a lower cost to training in the air.
