Report Overview:

A Helium Leak Sensor or Helium Leak detector is used to locate and measure the size of leaks into or out of a system or containing device. The tracer gas, helium, is introduced to a test part that is connected to the leak detector. The helium leaking through the test part enters through the system and this partial pressure is measured and the results are displayed on a meter.

Helium leak detectors consist of the following components:

A spectrometer to detect the mass of helium

A vacuum system to maintain the pressure in the spectrometer

A mechanical pump to evacuate the part to be tested

Valves which enable the various stages of detection: evacuation, test & venting

An amplifier and readout instrumentation to monitor the output signal

Power supplies and controls

Fixturing that attaches the part to be tested to the detector

Methods of Leak Testing Parts

There are two main methods to leak test parts using helium: Vacuum Testing (outside-in) and Pressure Testing (Inside-out). The detection method should be selected based on the working conditions of the part to be tested. It is important to maintain the same pressure conditions during the test as will exist during the actual use of the part. Vacuum systems should be tested with a vacuum inside the chamber. A compressed air cylinder should be tested with high pressure inside the cylinder.

The Global Helium Leak Sensor Market Size was estimated at USD 155.43 million in 2023 and is projected to reach USD 169.96 million by 2029, exhibiting a CAGR of 1.50% during the forecast period.
