Abstracts

Helium neon laser tubes are gas-based laser devices that utilize a mixture of helium and neon gases within a sealed glass tube to produce coherent light emission, primarily at a wavelength of 632.8 nanometers (red visible light), though other wavelengths such as 543.5 nm (green) and 1,152 nm or 3,391 nm (infrared) are also possible depending on cavity design and mirror coatings. These lasers operate through a process of electrical discharge excitation, where an applied voltage ionizes the gas mixture, leading to population inversion and stimulated emission as electrons transition between specific energy levels in neon atoms, with helium acting as an energy transfer medium to enhance efficiency. Characterized by their relatively low power output (typically ranging from 0.5 to 50 milliwatts), excellent beam quality, high coherence length, and intrinsic frequency stability, helium neon laser tubes are valued for applications requiring precise alignment, interferometry, holography, barcode scanning, educational demonstrations, and laboratory instrumentation, though they have seen gradual displacement by more compact, efficient, and cost-effective semiconductor diode lasers in many commercial and industrial contexts.

The global Helium Neon Laser Tubes market size was estimated at USD 35.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -2.10% during the forecast period.
