### Report Overview:

Hemoglobin is a protein found in the red blood cells. Its job is to carry oxygen from the lungs to all other parts of the body. Hemoglobin also has the ability to bind with glucose in the bloodstream; this type of bonding is called glycation.

The glycation process is irreversible so glycated hemoglobin (HbA1c) remains in its evolved state for the lifespan of the red blood cell - approximately 8-12 weeks. By measuring the amount of HbA1c in the blood it is possible to determine average blood glucose control over an 8-12 week period. The more HbA1c in your blood, the less controlled a patient's diabetes is and the more susceptible they are to developing long-term health complications.

HbA1c levels, which reflect the average plasma glucose concentration over the preceding three months, play a pivotal role in the diagnosis, assessment, and monitoring of diabetes.

The immediate feedback of HbA1c levels is highly effective for controlling plasma glucose levels.
