Report Overview

The hemophilia treatment drugs market is experiencing entry of a large number of new drugs in the market. Few of them have already arrived and other long lasting clotting factors and more promising drugs are on their way to get launched in this market. For instance, follow up data from phase I/II study of hemophilia medicine 'Emicizumab' by Roche has demonstrated promising results regarding safety and prophylactic efficiency in people with severe hemophilia A. Another example is of 'Eloctate' for type A and 'Aprolix' for type B hemophilia, respectively. These two newly arrived biogen products are opposed to commonly prescribe course of three infusions per week as they are longer-acting than traditional treatments and require only one to two infusions per week, due to their new mechanism of action.

With increasing attention on prophylactic treatment, the market for hemophilia drugs is estimated to have a positive outlook over the coming years. The prophylactic treatment approach prevents spontaneous bleeding episodes, significantly improves the quality of life in terms of physical activities, and maintains the level of clotting factors above a baseline. According to the studies conducted by the US National Library of Medicine determined that the savings on prophylactic treatment be approximately USD 8,312 to USD 17,675 per bleeding episode in a person. Moreover, this line of treatment reduces joint damage and suffering from pain. Several of such long-acting therapeutics are under development and expected to be launched over the next four years. The shift in preference for prophylactic treatment due to its advantages will drive this market's growth over the forecast period.
