Abstracts

The market for Hepatitis B virus (HBV) treatment encompasses a range of therapeutic interventions aimed at suppressing viral replication, reducing liver inflammation and fibrosis, and preventing long-term complications such as cirrhosis and hepatocellular carcinoma. Key treatment modalities include nucleos(t)ide analogues (NUCs), such as tenofovir and entecavir, which inhibit viral polymerase, and interferon-based therapies, including pegylated interferon-alpha, which modulate the immune response. Treatment strategies are tailored based on factors like viral load, liver enzyme levels, disease stage, and patient comorbidities, with the goal of achieving sustained virological suppression and biochemical remission. While current therapies rarely achieve complete viral eradication (functional cure), ongoing research focuses on novel agents targeting different stages of the HBV life cycle, immune modulators, and combination therapies to improve functional cure rates. The market is driven by the high global prevalence of chronic HBV infection, particularly in Asia-Pacific and sub-Saharan Africa, increasing diagnosis rates, growing awareness, and advancements in therapeutic options.

The global Hepatitis B Virus Treatment market size was estimated at USD 3526.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
