Abstracts

Hepatitis C Virus (HCV) refers to a bloodborne pathogen that causes hepatitis C, a liver infection that can range from a mild illness lasting a few weeks to a serious, lifelong condition leading to cirrhosis, liver cancer, or liver failure. The virus is primarily transmitted through exposure to infected blood, such as through sharing needles, unsafe medical practices, or, less commonly, through sexual contact or from an infected mother to her baby during childbirth. HCV is characterized by its high genetic variability, with multiple genotypes and subtypes that influence disease progression and treatment response. Chronic infection often develops silently over decades without noticeable symptoms, making early detection challenging yet critical for preventing severe liver damage. Advancements in antiviral therapies, particularly direct-acting antivirals (DAAs), have transformed HCV into a curable disease in most cases, significantly reducing the burden of long-term complications and transmission risk.

The global Hepatitis C Virus (Hcv) market size was estimated at USD 13250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
