Abstracts

Hepatitis D, also known as delta hepatitis, is a liver infection caused by the Hepatitis D virus (HDV). It is considered a satellite virus, as it requires the presence of the Hepatitis B virus (HBV) to replicate and cause infection. HDV infects individuals either as a co-infection with HBV or as a superinfection in those already infected with HBV. Hepatitis D is caused by the HDV, which can only infect individuals already infected with HBV. HDV can spread through contact with infected blood or body fluids, similar to HBV transmission routes. Injection drug use, exposure to infected blood, or unprotected sexual contact with an HBV/HDV-infected person are common risk factors for acquiring Hepatitis D. The increasing global prevalence of HDV infection is a significant market driver that is boosting the Market CAGR. HDV infection, which occurs along with hepatitis B virus (HBV) infection, is considered the most severe form of viral hepatitis, resulting in increased morbidity and fatality rates. The World Health Organization (WHO) estimates that over 15-20 million people globally are chronically infected with HDV. This growing incidence of HDV infection highlights the critical need for improved diagnoses, therapies, and preventive measures, which will drive market expansion.

The global Hepatitis Delta Virus (HDV) Infection market size was estimated at USD 1620.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 30.00% during the forecast period.
