Abstracts

Hepatitis D, also known as delta hepatitis, is a liver infection caused by the Hepatitis D virus (HDV). It is considered a satellite virus, as it requires the presence of the Hepatitis B virus (HBV) to replicate and cause infection. HDV infects individuals either as a co-infection with HBV or as a superinfection in those already infected with HBV. Hepatitis D is caused by the HDV, which can only infect individuals already infected with HBV. HDV can spread through contact with infected blood or body fluids, similar to HBV transmission routes. Injection drug use, exposure to infected blood, or unprotected sexual contact with an HBV/HDV-infected person are common risk factors for acquiring Hepatitis D.

The global Hepatitis Delta Virus Hdv Infection market size was estimated at USD 1616.44 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 30.00% during the forecast period.
