## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hepatocyte Culture Medium competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Hepatocyte culture medium is a nutrient solution designed specifically for the in vitro culture of hepatocytes (such as primary hepatocytes, hepatoma cell lines, or hepatocyte-derived hepatocytes derived from stem cells). It contains amino acids, vitamins, inorganic salts, glucose, and various growth factors and hormones (such as insulin, transferrin, dexamethasone, and epidermal growth factor). These nutrients maintain the morphology, function, and metabolic activity of hepatocytes, supporting their adherent growth and proliferation. This medium is typically formulated in a low-serum or serum-free format to minimize batch variability and enhance experimental reproducibility. It is widely used in drug metabolism studies, hepatotoxicity assessments, viral infection models (such as hepatitis B and C), and the exploration of liver physiology and pathology. In 2024, the global production of hepatocyte culture medium will reach 243,190 units, with an average selling price of US\$320 per unit.

The global Hepatocyte Culture Medium market size was estimated at USD 77.82 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
