Abstracts

Her 2 negative breast cancer refers to a subtype of breast cancer in which the cancer cells do not overexpress the human epidermal growth factor receptor 2 (HER2) protein, distinguishing it from HER2-positive breast cancer. This category includes both hormone receptor-positive (HR+) and triple-negative breast cancer (TNBC) subtypes, which have distinct biological behaviors and treatment approaches. The absence of HER2 amplification means that targeted therapies like trastuzumab are not applicable, shifting the treatment focus to endocrine therapies for HR+ cases and chemotherapy or emerging immunotherapies and PARP inhibitors for TNBC. Diagnosis relies on immunohistochemistry (IHC) and fluorescence in situ hybridization (FISH) testing to confirm HER2 negativity, which is critical for determining prognosis and guiding therapeutic decisions, as HER2-negative tumors generally exhibit different growth patterns, metastatic tendencies, and response profiles compared to HER2-positive disease.

The global Her 2 Negative Breast Cancer market size was estimated at USD 9800.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
