Abstracts

Her2 targeted therapy is a category of anticancer treatments specifically designed to target cancer cells that overexpress the human epidermal growth factor receptor 2 (HER2), a protein that promotes aggressive tumor growth; these therapies include monoclonal antibodies such as trastuzumab and pertuzumab, antibody-drug conjugates like trastuzumab emtansine (T-DM1) and fam-trastuzumab deruxtecan (T-DXd), and tyrosine kinase inhibitors such as lapatinib and neratinib, which work by either blocking HER2 signaling pathways, delivering cytotoxic agents directly to HER2-positive cells, or inhibiting downstream proliferation signals, thereby offering a more precise and effective approach compared to traditional chemotherapy, particularly in HER2-positive breast, gastric, and other cancers. The global market for HER2-targeted therapies is substantial and expanding, driven by rising incidence of HER2-positive cancers, advancements in diagnostic techniques enabling better patient identification, and continuous innovation in therapeutic agents, including next-generation antibody-drug conjugates and combination regimens; key players such as Roche/Genentech, Daiichi Sankyo, AstraZeneca, and Seagen dominate the landscape, with robust pipelines focusing on enhancing efficacy, overcoming resistance, and expanding into earlier lines of treatment and additional cancer types, while market growth faces challenges like high treatment costs, reimbursement hurdles, and the emergence of biosimilars for older biologics, though increasing adoption in emerging markets and ongoing clinical research into novel targets and mechanisms present significant opportunities for future expansion.

The global Her2 Targeted Therapy market size was estimated at USD 13200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
